

Panasil® A-silicone-based impression material

For precise impression results – even in extreme situations

Precision without compromise, that's what **Panasil®** – the precision impression material from Kettenbach Dental – stands for. With its convincing product properties and coordinated product combinations, the **Panasil®** product family offers the right material for every impression technique and indication.

Panasil® above all stands out by virtue of its unique hydrophilic properties ensuring a high level of detail reproduction and hence accurate impressions even in extreme conditions. So impressions also succeed in a moist environment.

High performance in every application

The **Panasil®** product family offers perfectly coordinated, innovative materials for all impression techniques and indications. Whether low, medium or high-viscosity as well as hand-mixing material: all **Panasil®** A-silicone-based impression materials are persuasive with their modern formulations.

Advantages to inspire users

Panasil® binetics Putty Fast is a genuinely hand-mixing putty based on A-silicone for precision impressions from a 5:1 jumbo cartridge designed to impress with their economy, easy and hygiene. As a tray material with putty consistency, it is ideally suited for corrective impressions. The ease of trimming and the particularly high dynamic pressure make the product a popular material.

Panasil® tray Soft Heavy is ideally suited as a tray material for the double-mix technique. Its high stability is equally as impressive as its easy trimming and simple removal.

Panasil® monophase Medium offers an ideal combination of outstanding flowability, extraordinary hydrophilicity and high final hardness, so it is the first choice for implant impressions using the monophase impression technique.

Unique hydrophilicity

Thanks to its unique hydrophilicity, **Panasil®** initial contact, the corrective material in the family, immediately overcomes any residual moisture on

direct contact with the tooth surface. This extremely fast spreading of moisture allows preparation margins to be prepared with detail reproduction. So impressions may be taken successfully in a moist environment with an exceptionally precise result – even in extreme situations like difficult hemostasis.

Award Winner 2024

The leading research publication from the USA, The Dental Advisor, regularly awards the highest quality materials used in dentistry. So they did for 2024 and again they have awarded **Panasil®** as "Preferred Product 2024 Impression material". The experts from The Dental Advisor test dental products and their properties and evaluate them across a number of categories. For **Panasil®** precision impression material they argue, it is a modern classic and it provides an ideal tray and correction material for every indication and technique.

If you value high accuracy & ease in workflow, safety and precision when taking impressions, **Panasil®** is your choice. With their convincing product properties, it is no wonder that **Panasil®** line precision impression materials have been problem solvers in dental practice for over four decades now.

Preliminary impression for two-step technique with Panasil® binetics

Final impression with Panasil® initial contact X-Light as correction material

Double-mix impression with Panasil® tray Soft & Panasil® initial contact Light

High level of detail, even subgingivally

Double-mix impression with Panasil® monophase Medium & Panasil® initial contact shows extraordinary details

Implant impression with Panasil® monophase Medium in an individual tray
